ABSTRACT

Six tables present data on nationwide school enrollment among various socioeconomic and demographic groups in 1981 and earlier years. From 1980 to 1981, total school enrollment continued the downward trend that began 6 years earlier, as the number of elementary school students declined and the number of high school students leveled off and then declined. Three tables give data on 1965-81 enrollment among persons aged 3 to 34, broken down by educational level, race, Spanish origin, age, sex, and public or private control of the school. The remaining tables cover college enrollment from 1965-81 by sex, race, and Spanish origin; from 1972-81 by age and sex; and from 1970-81 by type of college, attendance status, age, and sex. (MLF)

# School Enrollment — Social and Economic Characteristics of Students: October 1981 (Advance Report)

From 1980 to 1981, total school enrollment continued the downward trend that began 6 years before, as the number of elementary school students declined and the number of high school students leveled off and then declined. In October 1981, 58.4 million persons 3 to 34 years old were enrolled in school, including 2.1 million in nursery school, 3.2 million in kindergarten, 27.8 million in elementary school, 14.6 million in high school, and 10.7 million in college. The data are from the October 1981 school enrollment supplement to the monthly Current Population Survey.

Two series of data are shown for 1981 when survey estimates were inflated separately to independent population estimates based on the 1970 census and to independent estimates based on the 1980 census. The 1980 census showed marked differences in population figures by age in comparison with independent estimates for the same year built on the results of the previous census. This is particularly apparent among persons of school age. When enrollment rates found in the 1981 survey for each age, race, and sex group were applied to the 1980 census-based population estimates for these groups, the total number of persons enrolled was larger than the number derived using the 1970 census-based estimates. In this report, comparisons of figures for 1981 with data for 1976 to 1980 are based on 1970 census-based estimates for each year. All other discussion of figures for 1981 involve 1980 census-based estimates. A more detailed account of the impact of the introduction of new population controls will appear in the final enrollment report for 1981.

From 1980 to 1981, elementary enrollment declined slightly to about 18 percent below its 1970 peak; high school enrollment did not decline, but, in 1981, it was 9 percent below its apparent 1976-77 peak. Kindergarten enrollment did not change significantly from 1980 to 1981, but it was about 12 percent below the mid-1970's peak. At the nursery school level, enrollment did not change significantly during the 1980-81 period, but the number enrolled was about twice the number enrolled a decade earlier, largely because of substantial increases in enrollment rates of the eligible age groups: 3- and 4-year-olds (table 2). College enrollment did not change significantly during the period.

**Private school enrollment.** The proportion of all elementary and secondary students enrolled in private schools in 1981 was about the same as in 1971. Among elementary school students, 11 percent were attending private schools in 1971 and in 1981. The private elementary school enrollment rate declined from 15 percent in 1964 to about 10 percent in the mid-1970's. (See table.) The apparent increase in the proportion of elementary school children enrolled in private schools in the late 1970's did not continue. The proportion has been 11 percent since 1977, and the number of students in private elementary schools has not risen since the decline ended in the mid-1970's. The influx of smaller birth cohorts into elementary schools, which began in the late 1960's, has caused substantial enrollment reductions in all types of schools. This undoubtedly affected private school enrollment along with public school enrollment as the numbers of students enrolled in both types of schools declined over the last decade. There were less than two-thirds as many students enrolled in private elementary schools in 1981 as in 1964 (3.0 million vs 4.9 million). For a decade, private high school enrollment has not varied significantly from the most recent figure of 7.6 percent; at its peak in the mid-1960's, it was about 11.0 percent of all high school enrollment.[1] At the nursery school level, two-thirds of the students were in private schools in 1981. Among kindergarten students the figure was 17 percent (table 1).

**Enrollment rates by age.** School enrollment rates by age show some variation by race and ethnicity at noncompulsory school attendance ages (table 6). The rates did not vary substantially at the compulsory school ages, with 98 percent or better of all persons between 7 and 15 years old enrolled in school. At nursery-school ages, 36 percent of all 3- and 4-year-olds were enrolled in school in 1981, with similar proportions for White and Black children; only 25 percent of children of Spanish origin were enrolled. Above the compulsory attendance ages, there were also differences:

[1]Consistent with 1980 census-based population estimates.
[2]Consistent with 1970 census-based population estimates.

about 91 percent of both Black and White 16- and 17-year-olds were enrolled in school in 1981; for Spanish-origin youth, the figure was 83 percent. At ages 18 and 19, persons of Spanish origin also remained less likely than Blacks or Whites to be enrolled in school; among those of Spanish origin, only 38 percent of 18- and 19-year-olds were in school, but among Blacks and Whites, roughly one-half were still enrolled in school. One-fifth of White persons 18 and 19 years old enrolled in school were enrolled in high school, the remainder in college. For Black and Spanish-origin 18- and 19-year-olds, about two-fifths of those enrolled in school were still attending high school.

About 39 percent of White 18- and 19-year-olds were attending college; the figure for Blacks and for persons of Spanish origin together was only about one-fourth. However, for each race or ethnic group one-half or close to one-half of 18- and 19-year-old high school graduates were attending college. Thus, overall differences by race and ethnicity in college attendance are due to differences in the proportion becoming eligible, i.e., graduating from high school.

At older ages ethnic and racial differences in enrollment rates disappear rapidly. According to data in table 6, the percentage enrolled among persons 20 and 21 years old was lower than average for Black and Spanish-origin persons. Beyond age 21, there were no significant differences. (Only the youngest group of persons of Spanish origin showed evidence of lower than average attendance).

Perhaps the most important differences were in the proportions of the age group who were not enrolled in school and not high school graduates, i.e., dropouts. Among civilian 18- and 19-year-olds, 16 percent of Whites and 9 percent of Blacks were dropouts. The difference is significantly less than that recorded in 1967 (the first year such data were available) when 16 percent of Whites and 26 percent of Blacks of the same age were dropouts.[3] For persons of Spanish origin, the dropout rate is fully double the national figure; 36 percent of 18- and 19-year-old persons of Spanish origin were dropouts in 1981.

**College enrollment.** Among persons under 35 years old, college enrollment was 10.7 million in 1981; it has remained around 10 million since 1976. When students of all ages are considered, including those 35 years old and over, college enrollment was about 12 million in 1981. The proportion of college students under 35 years old who were attending school full time was 70.5 percent in 1981, about the same as in the previous 4 years. In 1970, the proportion enrolled full time was much higher, 77.7 percent (table 1). The number of persons enrolled full time did not decline from 1970 to 1981, but rose by one-third to 7.6 million in 1981, while the number enrolled part time about doubled to 3.2 million. In 1970, one-half million Black students attended college; in 1981, Black college enrollment was about 1.1 million. This figure has remained about the same since 1976. Spanish college enrollment reached one-half million in 1981. In 1972, the first year data were available separately for persons of Spanish origin, the figure was about one-quarter million. In 1981, Blacks constituted 10.6 percent of all college students, and Spanish-origin students constituted 4.8 percent; in 1972 the figures were 8.7 and 2.9 percent, respectively.

Among all college students 14 years old and over, women outnumbered men in 1981, just as they did in 1979 and 1980. The ratio for students of all ages was 108 women for every 100 men. In 1972, the first year data for college students of all ages were available, men enrolled in college outnumbered women by 1.3 million, and the ratio of women to men was only 0.74. In all age groups between 20 and 34 years old in 1972, more men than women were attending college; only at the youngest and oldest ages shown in table 4 did the number of men not exceed the number of women on campus.

From 1972 to 1981, total college enrollment grew by 33 percent, reflecting a 12-percent increase for men and a 63-percent increase for women. Young male students (under

[3]U.S. Bureau of the Census, Current Population Reports, Series P-20, No. 190, *School Enrollment: October 1968 and 1967.*

25 years old) dropped from 40 to 32 percent of all students, while young women constituted 32 percent of all students in both years. Women 25 years old and over increased from 11 to 20 percent of the total, while men in this age group remained between 16 and 17 percent of all students. Students of "traditional college ages" (21 or under) were no longer the majority of all college students in 1981.

The college enrollment survey figures presented thus far include full-time and part-time students, undergraduates and graduates, those in universities, other 4-year colleges, 2-year colleges, and professional schools. While the rise in the college attendance is particularly marked for women, it cannot be attributed solely to increased part-time attendance or continuing education because one-half of the increase was in full-time enrollment. Among students 14 to 34 years of women reached about the same level as men in full-time undergraduate enrollment, but they exceeded men in part-time enrollment in 1981. In 2-year colleges, the total number of women exceeded the number of men with a women/men ratio of 1.17 in 1981. In 1972, the number of men exceeded the number of women in 2-year colleges, and the ratio of women to men was only 0.70.

The number of women has increased in relation to that for men at all levels of school and all enrollment statuses. While in 1972, they were greatly outnumbered by men, by 1981, women were on a par with men in full-time undergraduate enrollment and getting closer in graduate school enrollment. Among the 1.7 million graduate students in 1981, men outnumbered women by 176,000 with the difference appearing to be in full-time students. In fact, among the larger group of male graduate students, 55 percent attended full time, while among female graduate students, 42 percent attended full time.

The growth in undergraduate enrollment between 1972 and 1981 did not affect 2-year and 4-year colleges equally. In 1981, 2-year colleges enrolled 32 percent of undergraduates; in 1972, they enrolled only 27 percent of undergraduates. This group of schools absorbed one-half of the growth in undergraduate enrollment in the 9-year period. As they did among all undergraduates, there is some evidence that women contributed over three-fourths of the growth in the number of 2-year college students.

Although women constituted one-half of full-time undergraduate enrollment in 1981, they remained behind men with only 38 percent of full-time graduate enrollment. Data from other sources show women do not yet graduate from college at the same rate as men.[3] It remains to be seen if the current similar enrollment figures for men and women (table 5) will produce equal proportions of college graduates in the future.

# Appendix. Source and Reliability of Estimates

## SOURCE OF DATA

The estimates of school enrollment in 1981 are based on data obtained in October 1981 from the Current Population Survey (CPS) conducted by the Bureau of the Census. The CPS sample was initially selected from the 1970 census file and is updated continuously to reflect new construction where possible. The October sample was spread over 629 areas comprising 1,148 counties, independent cities and minor civil divisions with coverage in each of the 50 States and the District of Columbia. The sample is composed of approximately 60,500 occupied households that are eligible for interview. Of this number, about 2,500 occupied units were visited, but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason. For a description of the CPS sample designs prior to 1980, see the detailed report for 1979 in this series.

The estimation procedure used for this survey involved the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race and sex. These independent estimates are based on statistics from decennial censuses; statistics on births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces.

Two sets of estimates for 1981 are shown in some of the tables in this report; one set results from using independent population estimates based on the more up-to-date 1980 decennial census and the other set results from using 1970 census based population estimates. The 1970 based estimates have been included to provide continuity in the time series with previous years. Comparing the 1980 based estimates with the 1970 based estimates provides a measure of the effect of changing to the 1980 based estimation procedure.

## RELIABILITY OF ESTIMATES

Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The standard errors provided for this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

**Use of school enrollment data for persons of Spanish origin.** Methodological changes which occurred in 1980 resulted in relatively large increases in the estimated number and proportion of children 3 to 13 years old who are of Spanish origin. Consequently, when using school enrollment data for persons of Spanish origin, particular care should be exercised in comparing estimates for 1980 and later years of the total number of children enrolled in nursery school, kindergarten, and/or elementary school with estimates from earlier years. These changes do not affect school enrollment rates reported for persons of Spanish origin.

**Sampling variability.** The standard errors presented in tables A-1 and A-2 are primarily measures of sampling variability; that is, of the variations that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its standard error enable one to construct interval estimates that include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these surveyed under identical conditions using the same sample design; and an estimate and its standard error were calculated from each sample, then:

1. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

2. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

The average result of all possible samples may or may not be contained in any particular computed interval. However, for a particular sample one can say with specified confidence that the average result of all possible samples is included within the constructed interval.

All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better, and most have passed a hypothesis test at the 0.05 level of significance or better. This means that, for most differences cited

**Table A-1. Standard Errors of Estimated Numbers of Persons Enrolled in School, for the Total, Black, and Spanish-Origin Population: October 1981**

(Numbers in thousands)

| Enrollment | Total | | Black | | Spanish origin | |
|---|---|---|---|---|---|---|
| | Estimate | Standard error | Estimate | Standard error | Estimate | Standard error |
| Total enrolled | 58,390 | 244 | 8,350 | 104 | 4,551 | 122 |
| Nursery | 2,058 | 68 | 284 | 26 | 131 | 18 |
| Private | 1,396 | 56 | 102 | 15 | 63 | 12 |
| Kindergarten | 3,161 | 82 | 474 | 33 | 306 | 27 |
| Private | 545 | 30 | 62 | 12 | 24 | 8 |
| Elementary | 27,795 | 129 | 4,291 | 94 | 2,474 | 74 |
| Private | 3,037 | 81 | 204 | 22 | 235 | 23 |
| High school | 14,642 | 155 | 2,168 | 64 | 1,130 | 64 |
| College | 10,734 | 137 | 1,133 | 48 | 510 | 37 |
| Full time | 7,569 | 118 | 815 | 42 | 343 | 29 |

Note: Data controlled to 1980 census base.

Source: Estimates from table 1.

in the text, the estimated difference between parameters is greater than twice the standard error of the difference. For the other difference mentioned the estimated difference between parameters is between 1.6 and 2.0 times the standard error of the difference. When this is the case, the statement of comparison will be qualified in some way; e.g., by use of the phrase "some evidence."

**Note when using small estimates.** Percent distributions are shown in this report only when the base of the percentage is greater than 75,000. Because of the large standard errors involved, there is little chance that percentages would reveal useful information when computed on a smaller base. Estimated numbers of persons are shown, however, even though the relative standard errors of these numbers are larger than those for the corresponding percentages. These smaller estimates are provided primarily to permit those combinations of the categories which serves each user's needs.

**Standard errors for data based on CPS.** Since this is an advance report, standard errors are provided in table A-1 and A-2 and standard error parameters are provided in table A-3 for estimated numbers of persons and estimated percentages for only certain characteristics which are considered the most important among the data in the report. A more complete source and reliability statement for the 1981 data will be published with the forthcoming 1981 detailed report.

**Table A-2. Standard Errors of Estimated Percentages of Persons 3 to 34 Years Old Enrolled in School, for the Total, Black, and Spanish-Origin Population: October 1981**

| Age | Total | | Black | | Spanish origin | |
|---|---|---|---|---|---|---|
| | Estimate | Standard error | Estimate | Standard error | Estimate | Standard error |
| Total, 3 to 34 years | 48.9 | 0.2 | 52.5 | 0.6 | 49.0 | 1.0 |
| 3 and 4 years | 36.0 | 0.9 | 36.7 | 2.4 | 24.5 | 2.5 |

**Standard errors of estimated numbers and estimated percentages.** The approximate standard errors of estimated numbers and percentages can be computed directly with formulas (1) and (2) below, respectively. The formulas are

$$\sigma_x = \sqrt{ax^2 + bx} \qquad (1)$$

where "x" is the size of the estimate and "a" and "b" are the parameters associated with the characteristic; and

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x} \cdot p \cdot (100-p)} \qquad (2)$$

where "x" is the size of the subclass of the population which is the base of the percentage, "p" is the percentage ($0 \leq p \leq 100$), and "b" is the parameter associated with the characteristic.

Table A-3 provides the values of the "a" and "b" parameters that are used in formulas (1) and (2) to approximate standard errors of estimated numbers of persons and estimated percentages.

**Standard error of a difference.** For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(x-y)} \doteq \sqrt{\sigma_x^2 + \sigma_y^2} \qquad (5)$$

where $\sigma_x$ and $\sigma_y$ are the standard errors of the estimates x and y; the estimates can be numbers, percents, ratios, etc. This will represent the estimated standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between two separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

**Table A-3. Parameters To Be Used for Each School Enrollment Characteristic for the Direct Computation of Standard Errors**

| Characteristic | Parameters[1] | |
|---|---|---|
| | a | b |
| Persons enrolled in school, 3-34 years old: | | |
| Total or White | -0.000017 | 2,014 |
| Black | -0.000117 | 2,265 |
| Spanish origin | -0.000028 | 3,374 |
| Persons enrolled in school, 14-34 years old: | | |
| Total or White | -0.000025 | 2,014 |
| Black | -0.000179 | 2,265 |
| Spanish origin (level) | [2]0.001519 | [2]1,856 |
| Spanish origin (percentage only) | (X) | [3]3,374 |
| Children enrolled in school, 3-13 years old: | | |
| All races and Spanish origin | -0.000063 | 2,350 |

(X) Not applicable.

[1]To obtain "a" and "b" parameters for 1965, multiply these parameters by 1.5.
[2]These "a" and "b" parameters are to be used to calculate standard errors of levels only for the October supplement. For the March supplement, Spanish origin, use a = 0.000901 b = 1101.
[3]This "b" parameter is to be used to calculate the standard error of percentages only. For the March supplement, use b = 2,002.
